

# **PEMEtrexed and CARBOplatin Therapy**

# **INDICATIONSFOR USE:**

INDICATION	ICD10	Regimen Code	Reimbursement Status
Treatment of chemotherapy naïve patients with unresectable malignant pleural mesothelioma.	C45	00318a	Hospital
First line treatment of patients with locally advanced or metastatic non-small cell lung cancer (NSCLC).	C34	00318b	Hospital

### TREATMENT:

The starting dose of the drugs detailed below may be adjusted downward by the prescribing clinician, using their independent medical judgement, to consider each patients individual clinical circumstances.

PEMEtrexed and CARBOplatin are administered once every 21 days for 4-6 cycles followed by maintenance PEMEtrexed monotherapy (Reference NCCP regimen 00222) or until disease progression or unacceptable toxicity develops.

Admin. Order	Day	Drug	Dose	Route	Diluent & Rate	Cycle
1	1	PEMEtrexed	500mg/m <sup>2</sup>	IV infusion	100ml 0.9% NaCl over 10min	Every 21 days
2	1	CARBOplatin	AUC 5	IV infusion	500ml glucose 5% over 60 min	Every 21 days
		Folic Acid or multivitamin containing 350-1000 micrograms folic acid	350- 1000micrograms <sup>a</sup>	PO		

<sup>&</sup>lt;sup>a</sup> At least five doses of folic acid must be taken during the seven days preceding the first dose of PEMEtrexed, and dosing must continue during the full course of therapy and for 21 days after the last dose of PEMEtrexed.

PEMEtrexed is physically incompatible with diluents containing calcium, including lactated Ringer's injection and Ringer's injection.

# **CARBOplatin dose:**

The dose in mg of CARBOplatin to be administered is calculated as follows:

# Dose (mg) = target AUC (mg/ml x min) x (GFR ml/min +25)

- Measured GFR(e.g. nuclear renogram) is preferred whenever feasible.
- **Estimation of GFR (eGFR)** can be done by using the Wright formula or using the Cockroft and Gault formula to measure creatinine clearance.
- The GFR used to calculate the AUC dosing should not exceed 125ml/min.
- For obese and anorexic patients the formulae may not give accurate results and measured GFR is recommended. Where obesity or overweight is likely to lead to an overestimate of GFR and isotope GFR is not available the use of the adjusted ideal body weight for Cockroft and Gault may be considered (3).

See Premedications for further treatment required.

# WRIGHT FORMULA

There are two versions of the formula depending on how serum creatinine values are obtained, by the kinetic Jaffe method or the enzymatic method. The formula can be further adapted if covariant creatine kinase (CK) values are available (not shown).

**1.** *SCr measured using enzymatic assay.* 

GFR (ml/min) = (6230 - 32.8 x Age) x BSA x (1 - 0.23 x Sex) SCr (micromol/min)

**2.**SCr measured using Jaffe assay

GFR (ml/min) =  $(6580 - 38.8 \times Age) \times BSA \times (1 - 0.168 \times Sex)$ SCr (micromol/min)

Key: Sex = 1 if female, 0 if male; Age in years; BSA= DuBois BSA

# **COCKCROFT-GAULT FORMULA**

GFR (ml/min) = S x (140 - age in years) x wt (kg) serumcreatinine (micromol/L)

S= 1.04 for females and 1.23 for males

# **ELIGIBILTY:**

- Indications as above
- ECOG 0-2

# **EXCLUSIONS:**

- Hypersensitivity to PEMEtrexed, CARBOplatin or any of the excipients
- Pregnancy and Lactation
- Pre existing neuropathies ≥ grade 2
- Significant hearing impairment/tinnitus

#### PRESCRIPTIVE AUTHORITY:

The treatment plan must be initiated by a Consultant Medical Oncologist.

# **TESTS:**

# **Baseline tests:**

- FBC, renal and liver profile
- Audiology and creatinine clearance if clinically indicated

NCCP Regimen: PEMEtrexed and CARBOplatin Therapy	Published: 03/05/2016 Review: 29/04/2025	Version number: 3
Tumour Group: Lung NCCP Regimen Code: 00318	ISMO Contributor: Prof Maccon Keane	Page 2 of 6

# Regular tests:

• FBC, renal and liver profile prior to each cycle

# Disease monitoring:

Disease monitoring should be in line with the patient's treatment plan and any other test/s as directed by the supervising Consultant.

# **DOSE MODIFICATIONS:**

• Any dose modification should be discussed with a Consultant.

#### Haematological:

- Dose adjustments at the start of a cycle should be based on nadir haematologic counts or maximum non-haematologic toxicity from the preceding cycle of therapy.
- Treatment may be delayed to allow sufficient time for recovery.
- Upon recovery patient should be retreated using the guidelines below.

#### Table 1: Dose modifications for haematological toxicity of PEMEtrexed and CARBOplatin

Based on Day 1 counts					
ANC (x10 <sup>9</sup> /L) Platelets (x 10 <sup>9</sup> /L) Dose of PEMEtrexed and CARBOplatin					
<1	and/or	<75	Delay treatment for one week		
Doses for subsequent	cycles are	reduced by 25% if ANC is	1-1.49 x109/L or platelets are 75 to 99 x109/L on day		
22 after preceding cy	cle				
Based on nadir count	ts				
≥ 0.5	and	≥ 50	100%		
<0.5	and	≥ 50	75% of previous dose		
any and <50 50% of previous dose					
Consider discontinuing therapy if a patient qualifies for a third dose reduction or a cycle is delayed by more than 21 days.					
Dose reductions should be	maintained fo	or subsequent cycles			

NCCP Regimen: PEMEtrexed and CARBOplatin Therapy	Published: 03/05/2016 Review: 29/04/2025	Version number: 3
Tumour Group: Lung NCCP Regimen Code: 00318	ISMO Contributor: Prof Maccon Keane	Page 3 of 6

The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. # **Renal and Hepatic Impairment:**

Table 2: Dose modification of CARBOplatin and PEMEtrexedin renal and hepatic impairment

	Renal Impairment		Hepatic Impairment			
CARBOplatin	See note below <sup>b</sup>		No dose reduction necessary			
PEMEtrexed	CrCl (ml/min)	Dose	Bilirubin Aminotransferas		Aminotransferases	
	≥45	100%	>1.5 x ULN	and/or or	> 3 x ULN (hepatic metastases absent) >5 x ULN (presence of hepatic metastases	Not recommended. Clinical decision
	<45	Not recommended				

# <sup>b</sup>Renal dysfunction and CARBOplatin:

- Patients with creatinine clearance values of < 60ml/min are at greater risk to develop myelosuppression.
- In case of GFR ≤ 20ml/min CARBOplatin should not be administered at all.
- If Cockroft & Gault or Wright formulaare used, the dose should be adjusted per cycle based on a serum creatinine obtained within 48 hrs of drug administration.
- If isotope GFR is used, the dose should remain the same provided the serum creatinine is ≤110%
  of its value at the time of the isotope measurement. If the serum creatinine is higher than this,
  consideration should be given to remeasuring the GFR or to recalculating using Cockroft & Gault or
  Wright formulae taking care this does result in a dose reduction.

# Management of adverse events:

Table 3: Dose Modification of PEMEtrexed and CARBOplatin for Adverse Events

Adverse reactions	Recommended dose modification
Non-haematologic toxicities a,b	
Any grade ≥3 toxicity other than mucositis	Withhold treatment until resolution to less than or equal to
or	patient's pre-therapy value
Any diarrhoea requiring hospitalisation	Resume at 75% of previous dose for both PEMEtrexed and
(irrespective of grade) or grade ≥3 diarrhoea	CARBOplatin
Grade ≥3 mucositis	Withhold treatment until resolution to less than or equal to
	patient's pre-therapy value
	Resume at 50% of previous dose for PEMEtrexed and at 100% of
	previous dose for CARBOplatin
Grade ≥3 toxicity after 2 dose reductions	Discontinue
Neurotoxicity	
Grade 2	Reduce dose of CARBOplatin to 50% of previous dose
Grade 3-4	Discontinue CARBOplatin and PEMEtrexed
Haematologic Toxicity	
Grade ≥3 toxicity after 2 dose reductions	Discontinue

 $<sup>^{\</sup>rm a}$ ,CTC v2.0; NCI 1998;  $^{\rm b}$  Excluding neurotoxicity

#### SUPPORTIVE CARE:

**EMETOGENIC POTENTIAL:** Moderate-High(Refer to local policy).

#### PREMEDICATIONS:

- A corticosteroid should be given the day prior to, on the day of, and the day after PEMEtrexed
  administration. The corticosteroid should be equivalent to 4 mg of dexamethasone administered orally
  twice a day.
- Intramuscular injection of vitamin B<sub>12</sub> (hydroxycobolamin) (1,000 micrograms) in the week preceding the first dose of PEMEtrexed and once every three cycles thereafter. Subsequent vitamin B<sub>12</sub> injections may be given on the same day as PEMEtrexed.

#### **OTHER SUPPORTIVE CARE:**

None usually required.

# ADVERSE EFFECTS / REGIMEN SPECIFIC COMPLICATIONS:

The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details.

- Myelosuppression: Usually the dose limiting toxicity with PEMEtrexed. PEMEtrexed should not be given to patients until absolute neutrophil count (ANC) returns to 1.5x10<sup>9</sup>/L and platelet count returns to 100x10<sup>9</sup> /L. Dose reductions for subsequent cycles are based on nadir ANC, platelet count and maximum non-haematologic toxicity seen from the previous cycle.
- **Skin reactions:** Pre-treatment with dexamethasone (or equivalent) can reduce the incidence and severity of skin reactions. **Cardiotoxicity:** Serious cardiovascular events including MI and cerebrovascular events have been uncommonly reported usually when PEMEtrexed is given in combination with another cytotoxic agent. Most of the patients in whom these events have been observed had pre-existing cardiovascular risk factors.
- Renal Toxicity: Serious renal events, including acute renal failure, have been reported with PEMEtrexed
  alone or in association with other chemotherapeutic agents. Nephrogenic diabetes insipidus and renal
  tubular necrosis were also reported in post marketing setting with PEMEtrexed alone or with other
  chemotherapeutic agents. Most of these events resolved after PEMEtrexed withdrawal. Patients should be
  regularly monitored for acute tubular necrosis, decreased renal function and signs and symptoms of
  nephrogenic diabetes insipidus (e.g. hypernatraemia).
- **Hypersensitivity:** Reactions to CARBOplatin may develop in patients who have been previously exposed to platinum therapy. However allergic reactions have been observed upon initial exposure to CARBOplatin.
- Neurotoxicity and ototoxicity: Ototoxicity and sensory neural damage should be assessed by history prior to each cycle.

# **DRUG INTERACTIONS:**

- In patients with normal renal function (CrCl> 80 ml/min), high doses of non-steroidal anti-inflammatory drugs (NSAIDs, such as ibuprofen > 1600 mg/day) and aspirin at higher dose (> 1.3 g daily) may decrease PEMEtrexed elimination and, consequently, increase the occurrence of PEMEtrexed adverse events.
- The concomitant administration of PEMEtrexed with NSAIDs or aspirin at higher dose should be avoided for 2 days before, on the day of, and 2 days following PEMEtrexed administration on patients with mild to moderate renal insufficiency (CrCl from 45 to 79 ml/min).
- In patients with mild to moderate renal insufficiency eligible for PEMEtrexed therapy, NSAIDs with long elimination half-lives should be interrupted for at least 5 days prior to, on the day of, and at least 2 days following PEMEtrexed administration.

NCCP Regimen: PEMEtrexed and CARBOplatin Therapy	Published: 03/05/2016 Review: 29/04/2025	Version number: 3

- Nephrotoxic drugs (e.g. loop diuretics and aminoglycosides) may decrease the clearance of PEMEtrexed.
- Concomitant administration of substances that are also tubularly secreted (e.g. probenecid, penicillin) could potentially result in delayed clearance of PEMEtrexed.
- Avoid concurrent use of CARBOplatin with nephrotoxic drugs (e.g. aminoglycosides, furosemide, NSAIDS)
   due to additive nephrotoxicity. If necessary monitor renal function closely.
- Avoid concurrent use of CARBOplatin with ototoxic drugs (e.g. aminoglycosides, furosemide, NSAIDS).
   When necessary perform regular audiometric testing
- Current drug interaction databases should be consulted for more information.
